Hiring Manager

[Company Name]

[Company Address]

Dear Hiring Manager,

I am writing to apply for the AI/ML Engineer or Software Developer position at [Company Name]. As a final-year B.Tech student specialising in Artificial Intelligence and Machine Learning at GMR Institute of Technology with a 9.50 CGPA and a published research paper in Generative AI, I bring both rigorous academic depth and practical, production-oriented engineering experience to every problem I work on.

My published research proposes a GAN-based pipeline to automatically convert social media text into animated visual sequences — a novel cross-modal generative AI application at the intersection of natural language processing and computer vision. This work required me to investigate state-of-the-art GAN architectures, design a generative pipeline from first principles, and contribute original findings to applied AI research. It reflects the systematic, curiosity-driven approach I bring to every technical challenge I undertake.

Beyond research, I have built systems with genuine real-world applicability. My Distracted Driver Detection System uses a fine-tuned VGG16 model with CNN-based feature extraction and transfer learning to classify driver behaviour — safe or distracted — in real time, optimised for deployment through data augmentation and hyperparameter tuning. I also co-built an LLM-powered Internship Recommendation Platform using OpenAI GPT embeddings and RAG, delivering semantically ranked, personalised results via a React and FastAPI stack. Both projects demonstrate my ability to bridge ML research and production engineering.

During my React JS internship at BRVS Tech LLC, I architected and delivered a full-stack Campus Management System within a four-week Agile sprint — a fully component-based React UI with state management, hooks, and a local storage persistence layer for a seamless single-page application experience without any back-end dependency. Delivering a production-ready system on schedule, independently, tested both my technical depth and my execution discipline under professional pressure.

I am a two-time inter-college technical competition winner, certified in Generative AI and Artificial Intelligence from Infosys Springboard, and hold further certifications from L&T EduTech, HackerRank, and GeeksforGeeks. My technical breadth spans Python, React.js, FastAPI, TensorFlow, GANs, CNNs, VGG16, transfer learning, OpenAI API, RAG, Prompt Engineering, and the full generative AI toolchain — alongside a live personal portfolio website showcasing my work directly to recruiters.

I am driven to build AI systems that are not only technically sophisticated but genuinely useful, and I believe [Company Name]'s work in [their domain] reflects exactly that standard. I would be delighted to discuss how my research background, engineering skills, and competitive track record can contribute to your team. I am available at your earliest convenience and happy to share project demos or code on request. Thank you sincerely for your time and consideration.

Yours sincerely,

Chipurupalli Poojitha Ramya
